AI-Assisted Release Notes Generator

Mini Assessment · Prompt Workflow Design

Student T. Pranadeep Reddy	**Registration No.** 99230041004
Department CSE-AIML	**Date** _____

Purpose

Design a three-stage prompt workflow that turns raw engineering updates into clear, reliable release notes. Complete each stage yourself and keep the output from one stage as the input to the next.

1. Scenario and audience

Describe the product, release, and intended readers. State what readers need to know and what details should be excluded.

2. Source material

Write or collect 6–8 short, fictional commit messages for one release. Include a mix of user-facing changes, internal maintenance, and at least one breaking change or known issue.

3. Stage One · Extract and classify

Write a prompt that asks an AI system to identify only user-relevant changes and group them into useful categories. Specify the output format and any limits.

Stage One output

Summarize the categorized changes here. Check that each item is supported by the source material.

4. Stage Two · Draft the release notes

Write a second prompt that uses only the Stage One output. Define the audience, tone, category order, sentence or bullet limits, and how to explain breaking changes.

Draft release notes

Paste or write the first draft produced from your Stage Two prompt.

5. Stage Three · Critique and refine

Create a review prompt with a checklist. Include completeness, factual support, category limits, readability, and migration guidance for breaking changes.

Critique findings and corrections

Record any issues found and the edits made. Do not add facts that are absent from the source material.

Final release notes

Write the revised version after applying the critique. Include a short note describing one limitation that still needs human review.

Reflection

Which stage prevented the most important error, and what evidence supports your answer?
